

Conserve Up Some Burgers

Eco-friendly barbecue tools

WORDS ALMA VERDEJO

LET ME SEE YA GRILL | Even if Memorial Day started off the barbecue season, we all know the best—and baddest—grilling occasions are just heating up. With global warming now seen as a real threat, we thought we could cook up a storm without actually causing CO₂ to rise. Here are some safe choices to save the environment and throw one hell of a party.

HOME PLATE
Preserve Tableware [\$16 per set]

An alternative to plasticware, these plates and cups are made from 100 percent recycled plastic called polypropylene. They are safe and durable, so the guests can use them, then you can reuse them. It's a win-win situation for everyone. recycline.com

PITCH IN
Recycle Tote [\$42]

Have guests use these unbreakable, lightweight containers. They help in identifying which recyclables you'll use and are easily stackable so as not to take up so much space. Make a game out of separating recyclables, and the winner gets to feel eco-happy. recyclingbin.com

LITTLE MR. SUNSHINE
Global Sun Oven [\$279]

Burning charcoal to cook up some burgers causes major smoke and environmental damage—hell, burnt food has even been linked to cancer-causing agents. Eliminate two problems at once by using a sun oven made of specular finish reflectors, which absorb the sun's rays without the need of a match. Food never burns, and the oven reaches over 400 degrees while keeping the food moist. sunoven.com

PANDA-MODIUM
Three Piece Bistro Set with Square Bamboo Table [\$230]

Turn the patio into a panda paradise. Bamboo is considered eco-friendly due to its hardy nature and availability. It's easier to replace in the environment than other types of wood. Prop up your feet while enjoying a nice, green meal with friends. csnstores.com

AW, SHUCKS
Corn-Based Cold Cups [\$112 per case]

Better than plastic, these corn-based cups are biodegradable and take less than 60 days to decompose. They retain the same standards as those other cups but make everyone feel a little better that they're pitching in to save the world, one sip at a time. ecoproducts.com
