

Coradiant Brings End-User Visibility to Akamai Application Performance Solutions

TrueSight Edge First To Provide End-user Monitoring for Akamai Application Acceleration

SAN DIEGO--(BUSINESS WIRE)--Coradiant, Inc. the leader in End-User Experience Management, today announced the immediate availability of Coradiant TrueSight™ Edge. TrueSight Edge is the first end-user experience management solution available that can enable organizations to see the benefits provided to each individual user for any Web application delivered by Akamai Technologies, Inc. (NASDAQ: AKAM), the leader in powering rich media, dynamic transactions and enterprise applications online.

Organizations are delivering an increasing number of Web applications optimized by Akamai® including rich internet applications (RIA), Web-enabled business processes, extranet portals and software-as-a-service (SaaS) applications. Now organizations can improve the delivery of Internet applications while gaining full visibility into the experience of each end-user.

[TrueSight Edge](#) provides accurate end-to-end transaction times, as experienced by users. Built-in dashboards provide side-by-side comparisons of non-accelerated versus Akamai-accelerated applications. Using these data-driven insights, IT organizations can better plan their infrastructure strategy by identifying applications that benefit from Akamai's portfolio of Application Performance Solutions.

TrueSight Edge is the result of the joint collaboration between Coradiant and Akamai. TrueSight Edge accurately represents performance perceived by end users using applications accelerated by Akamai's Application Performance Solutions, a suite of Web- and IP-enabled application delivery services. Organizations leveraging the integrated solution can now see a complete and consolidated view of end-user performance critical for managing incidents, reporting on service levels and driving business decisions such as global reachability and investments in scaling or optimizing application performance.

"At CSN Stores, TrueSight Edge is a logical and well-executed reporting bridge between our internally delivered services and the applications optimized by Akamai," said Dan Rowe, infrastructure architect, CSN Stores (csnstores.com). "It gives CSN Stores the needed visibility into Web traffic patterns and performance for sites that are offloaded by Akamai, giving us centralized system monitoring and reporting for all traffic data. This allows CSN to continuously monitor and enhance the customer shopping experience on all of our 200+ online stores."

"Coradiant's TrueSight allows us to see the performance of our on-demand service for every user. With the addition of Edge, we can now further extend our comprehensive monitoring solution to include quantitative performance metrics of traffic served by our own site and that delivered by Akamai's Application Performance Solutions," said Henryk Ciejek at [Bullhorn, Inc.](#) "With TrueSight Edge, we can enhance the measurable statistics of our Web application performance and reliability, so that we can best serve our Bullhorn customers worldwide."

"Enterprises now have complete visibility into true end user application performance across Akamai's Platform with Coradiant TrueSight Edge," said Willie M. Tejada, vice president, Application Acceleration for Akamai. "This view of their sites and applications gives the most accurate measure from an end-user perspective. Akamai customers can now directly compare the difference in performance "with and without" Akamai, and get a better appreciation of the advantages of utilizing Akamai Application Performance Solutions with TrueSight Edge."
